## **Experiment 8**

### **AIM**

To establish connection between server client using sockets.

### **THEORY**

#### **What is socket programming?**

Socket programming is a way of connecting two nodes on a network to communicate with each other. One socket (node) listens on a particular port at an IP, while other socket reaches out to the other to form a connection. Server forms the listener socket while client reaches out to the server. They form the backbones of web browsing.[1]

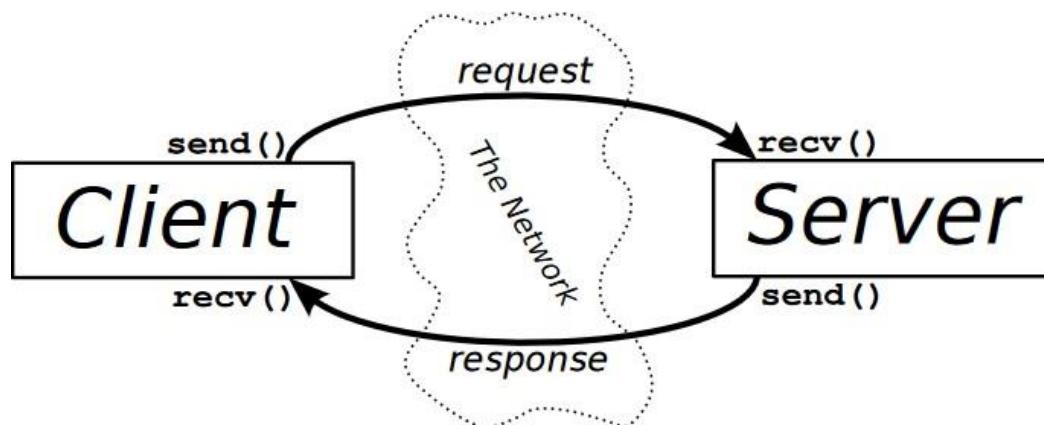

Figure 2: Client-Server Interaction.

The exchange of information between client and server is summarized in the above diagram.

A server has a `bind()` method which binds it to a specific ip and port so that it can listen to incoming requests on that ip and port. A server has a `listen()` method which puts the server into listen mode. This allows the server to listen to incoming connections. And last a server has an `accept()` and `close()` method. The `accept` method initiates a connection with the client and the `close` method closes the connection with the client.

A client has a `connect()` method which opens a TCP connection to the hostname on the port. Client also has a `recv()` method which receives the message.

## CODE

### Server:

```
import socket

print("server")
s = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
s.bind((socket.gethostname(), 8000))
s.listen(5)

while True:
    clientsocket, address = s.accept()
    print(f'Connection established with {address}')
    clientsocket.send(bytes('Hello World!', 'utf-8'))
    clientsocket.close()
```

### Client:

```
import socket

s = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
s.connect((socket.gethostname(), 8000))
msg = s.recv(1024)
print(msg.decode('utf-8'))
s.close()
```

## OUTPUT

### Server:

```
Command Prompt - python server.py
Microsoft Windows [Version 10.0.18363.1139]
(c) 2019 Microsoft Corporation. All rights reserved.

C:\Users\yashc>cd "OneDrive\Desktop\College Work\DCCN Lab\Experiment 8"

C:\Users\yashc\OneDrive\Desktop\College Work\DCCN Lab\Experiment 8>python server.py
server
Connection established with ('192.168.56.1', 51209)
Connection established with ('192.168.56.1', 51210)
Connection established with ('192.168.56.1', 51211)
```

### Client:

```
Command Prompt

C:\Users\yashc\OneDrive\Desktop\College Work\DCCN Lab\Experiment 8>python client.py
Hello World!

C:\Users\yashc\OneDrive\Desktop\College Work\DCCN Lab\Experiment 8>python client.py
Hello World!

C:\Users\yashc\OneDrive\Desktop\College Work\DCCN Lab\Experiment 8>python client.py
Hello World!

C:\Users\yashc\OneDrive\Desktop\College Work\DCCN Lab\Experiment 8>
```

## **CONCLUSION**

I understood the basics of socket programming and established a simple connection between client and server using the same.
